Bernier B., Goffinet A.M.;

"Comparative study of realin in vertebrates.";

"Comparative study of realin matrix serine protease that plays a role in layering of neurons in the cerebral cortex and cerebrallum.

"In layering of neurons in the cerebral cortex and receeballum."

Regulates microtubule function in neurons and neuronal migration. Affects migration of sympathetic preganglionic neuronal in the spinal cord, where it seems to act as a barrier to neuronal in the migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors viblic and ApoER2 induces Vrosine phosphorylation of Dab1 and modulation of Tau phosphorylation (By similarity).

In Invertion: Extracellular matrix serine protease that plays a role in layering of neurons in the cerebral cortex and cerebellum. Regulates microtubule function in neurons and neuronal migration. Affects migration of sympathetic preganglionic neurons in the spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDLR and ApoRRZ induces tyrosine phosphorylation of Dabl and modulation of Tau phosphorylation (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        schizophrenia. Expression of the protein is reduced (about 50%) in patients with schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -:- DOMAIN: The basic C-terminal region is essential for secretion (By
                                                                                                                                                                                                                                    **SUBCELLULAR LOCATION: Secreted (By similarity).

-!- ALTERNATIVE PRODUCTS: 3 isoforms; 1 (shown here), 2 and 3; are produced by alternative splicing.
-!- TISSUE SPECIFICITY: Abundantly produced during brain ontogenesis by the Cajal-Retzius cells and other pioneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layer of the cerebellum. In adult brain, preferentially expressed in GABABATGL interneurons of prefrontal cortices, temporal cortex, hippocampus and glutamatergic granule cells of cerebellum. Also expressed in fetal and adult liver.
-!- DEVELOPMENTAL STAGE: Expressed in fetal and postnatal brain and liver. Expression in postnatal human brain is high in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -:- DISEASE: Defects in RELN may predispose to autistic disorder. A polymorphic GGC tripler repeat located in the 5'UTR region of RELM (8 to 10 repeats) in the normal population is significantly increased in autistic patients (4 to 23 additional repeats).
-:- SIMILARITY: DELONGS TO THE REELIN FAMILY.
-:- SIMILARITY: CONTAINS 8 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              lissencephaly with cerebelar hypoplasia (Also known as Norman-
Noberts syndrome). Some patients also displayed persistent

produced by alternative splicing.

1. TISSUE SPECIFICITY: The major isoform 1 is neuron-specific. It is abundantly produced during brain ontogenesis by the Cajal-Retzius cells and other ploneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layer of the crebellum. Expression is located in deeper layers in the developing hippocampus and olfactory bulb, low levels of expression are also detected in the immature striatum. At early developing hippocampus and olfactory bulb, low levels of expression are also tected in the immature striatum. At early developmental stages, expressed also in hypothalamic differentiation fields, tectum and spinal cord. A moderate to low level of expression occurs in the septal area, striatal fields, habenular nuclei, some thalamic nuclei, particularly the lateral geniculate, the retina and some nuclei of the reticular formation in the central field of the medulla. Very low levels found in liver and kidney. No expression in radial glial cells, conficial plate, Purkinje cells and inferior clivary neurons. The minor isoform 2 is only expressed in non neuronal cells. The minor isoform 2 is only expressed in non neuronal cells. The minor isoform 2 is only expressed in non neuronal cells. The minor isoform 3 is found in the same cells as isoform 1, but is almost
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Affects migration of sympathetic preganglionic neurons in the spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDLR and ApoBR2 induces tyrosine phosphorylation of Dabl and modulation of Tau phosphorylation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             undetectable in retina and brain stem.

DEVELOPENTAL STAGE: First detected at embryonic day 11.5.

EXPRESSION increases up to birth and remains high from post-natal
day 2 to 11 in both cerebellum and fore/midbrain. Expression
                                                                                                                                                                                                                                                                                                                                                                                          Yip J.W., Yip Y.P.L., Nakajima K., Capriotti C.; "Reelin controls position of autonomic neurons in the spinal cord."; Proc. Natl. Acad. Sci. U.S.A. 97:8612-8616(2000).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1. FUNCTION: Extracellular matrix serine protease that plays a role in layering of neurons in the cerebral cortex and cerebellum. Regulates microtubule function in neurons and neuronal migration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          motor coordination, tremors and ataxia. Neurons in affected mice fail to reach their correct locations in the developing brain, disrupting the organization of the cerebellar and cerebral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           declines thereafter and is largely brain specific in the adult.
-- DOMAIN: The basic C-terminal region is essential for secretion.
-- PTM: N-glycosylated and to a lesser extent also 0-glycosylated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -1- SUBUNIT: Binds to the ectodomains of VLDLR and ApoER2.

                                              This peptide corresponds to amino acid residues 364-378 of human prothrombinase Fg12 (see AAW88235). A claimed method of preventing or treating a condition requiring a reduction in immune coagulation comprises administering an inhibitor of Fg12. The inhibitor is preferably an antibody that binds to the Fg12 epitope. The condition to be treated in graft rejection of foetal loss

allograft and xenograft rejection and foetal loss. An Fgl2-specific antibody, an Fgl2 antisense oligonucleotide, or a substance that affects prothrombinase activity of a Fgl2 protein may be used to treat a condition requiring a reduction in procoagulant activity. A vaccine containing an Fgl2 protein or peptide is used for prevention of graft rejection or foetal loss (claimed).
This is the amino acid sequence of mouse prothrombinase Fg12, as predicted from fg12 DNA (see AAV84140). Fg12 is a 70 kDa transmembrane serine prodease that has immune procoagulant activity. The human Fg12 amino acid sequence is given in AAW88336. The invention provides a method for inhibiting immune coagulation by used in vivo to treat a condition which requires a reduction in immune coagulation such as bacterial and viral infections, cancer, glomerulonephritis, a number of gastrointestinal diseases.

Sequences AREPJOZA-RAEPSOI TEPTESENT 4334 under procession designated ORP (Open reading frame) 1-4534, and sequences ARN7504-
ABN79587 represent cDNAs encoding them. The invention also encompasses copypeptides at least 80% identical to the ORP-ORF434 (collectively referred to as ORFX) proteins, polynoclecides at least 85% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX copymoclectides. The recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of screening for modulators of ORFX expression or cartivity, and methods of screening idividuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide cartivity, and methods of screening idividuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide cardivity, and methods of screening idividuals for a predisposition, call differentiation, immune modulation, membolytic activity, chemotractic/ clissue growth, angiogenesis, such as cytokine, cell proliferation, creeptor/ligand, antiinflammatory activity, thrombolytic activity, recoptor/ligand, antiinflammatory activity, tumour inhibition activity, cand antiinfective activity, and may also be involved in the determination and antiinfective activity, and may also be involved in the determination corporated acids and antibodies may be used in the treatment of cancers, corporated acids and antibodies may be used in the treatment of cancers, corporated acids and antibodies may be used in the treatment of cancers, corporated acids and antibodies may be used in the treatment of cancers, corporated acids and antibodies may be used in the treatment of cancers, corporated acids and antibodies may be used in the treatment of cancers, corporated acids and antibodies may be used in the produce of an activity and behaviour. ORFX proteins, corporated acids and antibodies may be used in the produce of an accordance of disorders such as epilepsy and Alzheimer's disease, immune sys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   storage disease, and infectious diseases caused by viral, bacterial, fungal and other pathogens. Offer nucleic acids may also be used as a source of primers and probes, in the detection of Offer genomic sequences or transcripts, in the identification and cloning of homologous sequences, in genetic diagnosis, and in foreneis big of nonlogous which may be useful for studying the function and/or activity of ORFX protein, and in drug screening. The ORFX protein, and in drug screening. The ORFX protein may also be used as immunogens to generate specific antibodies, which are useful in the diagnosis, treatment and monitoring of ORFX-associated diseases.

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical immaning of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AMD07705-AAD07759 represent cDNAs corresponding to 19 human secreted protein genes, and AAE03292-AAE03346 represent the proteins they encode. CC AAE03347 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene contractions, pathological conditions can be diagnosed by determining the mount of the new protein in a sample or by determining the presence of amount of the new protein in a sample or by determining the presence of amount of the new genes. Specific uses are described for each of the conditions of the second on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of abnormalities, hemanotopiteric disorders, foetal and developmental conditions and the same and products for the diagnosis or treatment of anormalities, hemanotopiteric disorders, foetal and developmental conditions are abnormalities, meurological disorders (e.g., rheumatoid arthritis), inflammation, conditions disposed to soniture disorders, and infections and disorders, and infections and infections are proteins can also be used to aid wound confine and epithelial cell proliferation, to prevent skin aging que to consume the maining and epithelial cell proliferation, to remaining representations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein fragment referred to in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           food additive or preservative to modify storage properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a fragment of a human protein which contains a SRCR (scavenger receptor, oysteine-rich) domain. The gene and encoded protein can be used to diagnose or treat tumours, particularly of the nervous system (medullo-blastoma or glioma) or breast. The DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and probes derived from it, are used to identify genes that express SRCR-domain containing proteins, to determine the form in which these proteins exist and to assess the significance of individual forms on cellular properties. The protein can be used to detect the presence of autoantibodies, and Ab which regulate its expression.
                                                                                   Scavenger receptor cysteine rich domain; SRCR; diagnosis; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This sequence represents a human protein which contains a SRCR (scavenger receptor, cysteine-rich) domain. The gene and encoded protein can be used to diagnose or treat tumours, particularly of the nervous system (meduilo-blastoma or glioma) or breast. The DNA sequence and probes derived from it, are used to identify genes that express SRCR-domain containing proteins, to determine the form in which these proteins exist and to assess the significance of individual forms on cellular properties. The protein can be used to detect the presence of autoantibodies and antibodies which regulate its expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; reelin; low density lipoprotein receptor; LDLR; neuroprotective; extracellular glycoprotein; nootropic; antilipeamic; Alzheimer's disease; neurodegenerative disorder: neuronal regeneration; cognitive function; lipid metabolism disease; memory; developmental disorder.

The present invention describes a composition (1) comprising an isolated reelin protein (II) bound to an isolated low density lipoprotein receptor (LDLR) (III). (II) is an extracellular glycoprotein of approximately 385 kba containing a small region of similarity with F-spondin at the N terminus, a stretch of positively charged amino acids at the C terminus, and a series of eight internal repeats of 350-390 amino acids, each repeat containing two related sub-domains that flank a pattern of conserved cysteine residues known as an epidermal growth factor (EGF-like motif. (1) has neuroprotective, noctropic and antilippemic activities, and can be used as a madulator of reelin-LDLR interaction. (I) is, useful in screen for compounds that system comprises a matcroplate array and an automated robotic extracellular glycoprotein; nootropic; antilipaemic; Alzheimer's disease; neurodegenerative disorder; neuronal regeneration; cognitive function; method are useful as therapeutic agents to provide or alleviate a diverse spectrum of diseases including neurodegenerative disorders such Mouse; reelin; low density lipoprotein receptor; LDLR; neuroprotective; as Alzheimer's disease, to facilitate neuronal regeneration after injury, to prevent or alleviate lipid metabolism diseases, to enhance cognitive functions and memory or to ameliorate other developmental disorders. The present sequence represents human reelin, which is used in the exemplification of the present invention. Novel composition useful for screening compounds that modulate Reelin microprocessor controlled system for adding and removing reagents to the microplate array. ```
The present invention describes a composition (1) comprising an isolated realin protein (II) bound to an isolated low density lipoprotein creceptor (LDLR) (III) is an extracellular glycoprotein of receptor (LDLR) (III) is an extracellular glycoprotein of approximately 385 kDa containing a small region of similarity with captoximately 385 kDa containing a small region of similarity with cards are the C terminus, and a series of eight internal repeats of acids at the C terminus, and a series of eight internal repeats of 390-390 anino acids, each repeat containing two related sub-domains contropic and antilipated cysteine residues known as an epidermal growth factor (EGF)-like motif. (I) has neuroprotective, nootropic and antilipatemic activities, and can be used as a modulator of realin-LDLR interaction. (I) is useful in screen for compounds that controllate array and an automated robotic modulate realin binding to an LDLR, in an assay system, where the assay system comprises a microplate array and an automated robotic the microplate array. The compounds identified by the above screening method are useful as therapeutic agents to provide or alleviate a diverse spectrum of diseases including neurodegenerative disorders such a controllate array.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 as Alzheimer's disease, to facilitate neuronal regeneration after injury, to prevent or alleviate lipid metabolism diseases, to enhance cognitive functions and memory or to ameliorate other developmental disorders. The present sequence represents mouse (Mus musculus) reelin, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or

genes (1) In a clear Sample Comprising genes selected from (1). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or wasopsatic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving represent PCR primers for ischaemic claiseases. AB19913 and ABB19914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The
                                                                                           The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample or determining the expression profile of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or treat disease states involving (II). (II) is useful for generating antibodies gainst it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical immaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polymerlectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             which encodes an apoptin-associating protein 5 (AAP-5) capable of providing apoptosis, or its functional fragment. The nucleic acid, a vector comprising the nucleic acid, or a proteinaceous substance is susful for the induction of p53-independent apoptosis. The pharmaceutical composition comprising the nucleic acid, vector comprising the nucleic acid or the proteinaceous substance is also useful for the induction of p53-independent apoptosis, or for the treatment of a disease where enhanced cell proliferation or decreased cell death is observed, such as
                                                                                                                                                                                                                                                                                                       diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
     polynucleotides are also used in diagnostics as expressed sequence tags
                                                                                                                                                                                                                                                                and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated or recombinant nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New apoptin-associating protein 5 for inducing p53-independent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  / Match 52.3%; Score 46; DB 22; Length 3470; Local Similarity 71.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated or recombinant nucleic acid which encodes an apoptin-associating protein 5 (AAP-5) capable of providing apoptosis, or its functional fragment. The nucleic acid, a vector comprising the nucleic acid, or a proteinaceous substance is useful for the induction of p53-independent apoptosis. The pharmaceutical composition comprising the nucleic acid, vector comprising the nucleic acid, vector comprising the nucleic acid, actor acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                enhanced cell proliferation or decreased cell death is observed, such as cancer or autoimmune disease. The present sequence represents the amino acid sequence of apoptin-associating protein 5 (AAP-5).
cancer or autoimmune disease. The present sequence represents the partial amino acid sequence of apoptin-associating protein 5~({\rm AAP}\text{-}5).
                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -independent apoptosis, or for the treatment of a disease where

```
The invention comprises the amino acid and coding sequences of two apoptin-associating proteins (AAP-5 and AAP-6). The AAP-5/AAP-6 DNA and protein sequences are useful for inducing p53·independent apoptosis, and the diagnosis/treatment (gene therapy) of cancer and autoimmune disease. The AAP-5/AAP-6 DNA and protein sequences are also useful for finding additional apoptin-associating proteinaceous substances from the apoptosis pathway cascade. The present amino acid sequence represents the human AAP-5 protein (with a region derived from the multiple cloning site of the PACT expression vector).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "This region is derived from the multiple cloning site in the pACT expression vector" % \left( \frac{1}{2}\right) =\frac{1}{2}\left( \frac{1}{2}\right) =\frac{1
                                                                                                                                                                                                                                                                                                            Human apoptin-associating protein 5, with pACT expression vector region.
